

● OBSIDIAN PROTOCOL: AUTONOMOUS WARFARE

COMMAND INTENT. UNLEASH AUTONOMY. WITNESS WAR EVOLVE.

Obsidian Protocol: Autonomous Warfare is a next-generation multiplayer military strategy and warfare simulation built around a simple idea:

You don't command every move. You command the war.

Build and maintain your own military force. Deploy aircraft, ground vehicles, naval units, reconnaissance systems, command platforms, and experimental technology. Establish objectives, priorities, rules of engagement, formations, doctrines, and operational intent.

Then let your military execute.

Your forces are not puppets waiting for individual orders. Every unit operates according to its capabilities, sensors, communications, role, doctrine, current orders, battlefield conditions, and understanding of the situation.

You give the intent.

Your military decides how to achieve it.

A DIFFERENT KIND OF RTS

Traditional real-time strategy games ask the player to constantly tell individual units what to do.

Obsidian Protocol takes a different approach.

Instead of spending an entire battle clicking from unit to unit, you operate as a commander.

You establish the mission.

You define the objective.

You determine the priorities.

You establish the rules of engagement.

You decide how aggressive your forces should be.

You determine what risks they are allowed to take.

Then your autonomous military interprets those decisions and attempts to accomplish them.

A reconnaissance unit may detect an enemy formation and investigate.

A commander may redirect nearby forces.

A support unit may reposition to maintain coverage.

A damaged unit may withdraw.

A formation may attempt to flank.

A force may stop advancing because communications have been lost.

A commander may make a decision based on incomplete or outdated information.

The battlefield does not wait for you to manually solve every problem.

It evolves.

COMMAND INTENT

The foundation of Obsidian Protocol is **Command Intent**.

Instead of issuing thousands of individual movement and attack commands, you communicate what you want your forces to accomplish.

Examples include:

Attack

Defend

Recon

Support

Escort

Retreat

Hold

Pursue

Flank

Suppress

Breach

Reinforce

Recover

Intent can also contain priorities and operational constraints.

You might order a force to:

Secure the northern approach. Avoid unnecessary losses. Maintain reconnaissance coverage. Withdraw if communications are lost.

The units beneath that command structure interpret the intent according to their own capabilities and circumstances.

This creates a military that behaves like a military rather than a collection of individually controlled game pieces.

AUTONOMOUS WARFARE

Every unit exists inside a larger autonomous system.

Units evaluate their environment, available information, mission objectives, threats, resources, mobility, damage state, communications, and command intent.

Their behavior can change as the battlefield changes.

A unit that was advancing confidently may suddenly become cautious after losing sensor coverage.

A commander that loses contact with its superior may continue its last known mission, alter its behavior according to doctrine, or enter a degraded operational state.

A reconnaissance element may discover something the main force does not know exists.

A damaged vehicle may withdraw instead of blindly continuing the attack.

A force operating without reliable information may make the wrong decision.

Intelligent behavior emerges from the systems interacting with one another.

INFORMATION IS POWER

You never automatically know everything happening on the battlefield.

Your military must **discover information**.

Sensors matter.

Detection matters.

Identification matters.

Communications matter.
Terrain matters.
Weather matters.
Time of day matters.
And uncertainty matters.
Your forces may detect something without knowing exactly what it is.
They may classify a contact incorrectly.
They may know where an enemy was several seconds ago without knowing where it is now.
They may receive information from another unit that is already outdated.
They may lose access to information entirely.
This creates a battlefield where knowledge itself becomes a strategic resource.

THE BATTLEFIELD'S NERVOUS SYSTEM

Military power depends on communication.
Units communicate with commanders.
Commanders communicate with subordinate forces.
Reconnaissance units distribute information.
Relay systems extend communication networks.
Data links allow battlefield intelligence to move between units.
But communication is not guaranteed.
Distance can matter.
Terrain can matter.
Interference can matter.
Damage can matter.
Signal degradation can matter.
A force operating with a strong communications network can coordinate effectively.
A force operating under degraded communications may become fragmented, slow, or uncertain.
This means destroying an enemy's ability to **understand the battlefield** can be just as important as destroying its units.

INFORMATION WARFARE

Obsidian Protocol treats information as part of warfare itself.
You are not simply fighting enemy vehicles.
You are fighting their ability to:
Detect you
Identify you
Track you
Communicate
Coordinate
Maintain situational awareness
Share intelligence
Maintain command authority
The battlefield can therefore be attacked physically **and informationally**.
Blind an enemy.
Break its communications.
Destroy reconnaissance.
Create uncertainty.
Exploit gaps in its knowledge.
Force commanders to operate with incomplete information.
A military that cannot see the battlefield cannot effectively control it.

A BATTLEFIELD THAT FIGHTS BACK

Battles are not predetermined sequences.
The systems interact.
Sensors detect units.
Units communicate.
Commanders interpret information.
Forces respond to threats.
Terrain affects movement and detection.
Weather affects operations.
Damage changes capabilities.
Communications can fail.
Units can become isolated.
Objectives can change.
Information becomes stale.
Unexpected events create new situations.
The result is a battlefield capable of producing situations the designers never explicitly scripted.
Every battle can become its own story.

YOUR MILITARY EXISTS OUTSIDE THE BATTLE

Your army is not simply a menu of units.
It is a military organization.
Between battles, you manage your force.
Acquire and maintain units.

Repair damaged equipment.
Manage resources.
Configure equipment.
Develop capabilities.
Customize units.
Organize your fleet.
Prepare deployments.
Analyze previous battles.
Make strategic decisions.
Your military can grow, change, suffer losses, and develop over time.
The battlefield therefore matters beyond the moment a match ends.

THE PHYSICAL MILITARY FACILITY

Your military has a physical presence.
The Garage is not simply a menu.
It is a facility.
Walk through your command center.
Inspect your vehicles.
Visit aircraft bays.
Move through maintenance areas.
Access fabrication systems.
Review your fleet.
Prepare deployments.
Visit specialized command areas.
See the machines that make up your military.
Your force becomes something you physically inhabit rather than something that exists only as icons on a screen.

FULL VR COMMAND

Obsidian Protocol is designed from the ground up to support a full VR command experience.
VR is not an isolated mini-game.
It is another way to inhabit the military.
Stand inside your command facility.
Inspect equipment.
Access command systems.
Interact with operational interfaces.
Monitor your forces.
Review battlefield intelligence.
Prepare deployments.
Move through your military facility.
The goal is to make the player feel like they are **inside the command structure**, not simply looking at another strategy-game interface.

A LIVING WORLD

The battlefield is affected by more than unit statistics.
Time changes.
Day becomes night.
Weather changes.
Visibility changes.
Terrain influences movement and detection.
Environmental conditions influence sensors and operations.
The same military can behave differently depending on the conditions in which it fights.
A reconnaissance operation that works perfectly during daylight may become dramatically more difficult at night.
A communication network that works across open terrain may struggle through difficult environments.
The battlefield itself becomes part of the tactical problem.

WAR REQUIRES LOGISTICS

A military cannot operate indefinitely without support.
Units require resources.
Operations require preparation.
Damaged equipment requires repair.
Manufacturing requires materials.
Deployment requires planning.
Sustained warfare creates logistical pressure.
A commander who wins every engagement but destroys their ability to maintain the force may still lose the war.
Obsidian Protocol therefore treats logistics as part of military strategy rather than an afterthought.

DEPLOYMENT IS A STRATEGIC DECISION

Owning a powerful military does not mean deploying all of it.
Multiplayer battles operate around a **Deployment Budget**.
For example:

10,000 Deployment Points

You may own dozens or hundreds of units, but the battlefield imposes a controlled deployment limit.
This creates an important distinction:

Ownership ≠ Battlefield Power

Players can build large persistent militaries without allowing unlimited spending to determine competitive outcomes.

Your deployment becomes a strategic decision.

Do you bring expensive heavy units?

More reconnaissance?

Air support?

Electronic warfare?

Logistics?

A balanced force?

A specialized force?

Every deployment is a decision.

BUILD YOUR FORCE

Your military can contain different categories of autonomous systems.

AIR UNITS

Reconnaissance drones, sensors, support aircraft, search-and-rescue systems, relays, surveillance platforms, and specialized autonomous aircraft.

GROUND UNITS

Combat vehicles, patrol systems, recovery vehicles, logistics platforms, reconnaissance units, heavy machines, and specialized ground systems.

NAVAL UNITS

Surface vessels, reconnaissance platforms, sonar systems, rescue vessels, harbor systems, and specialized naval units.

COMMAND UNITS

High-level command, strategic coordination, intelligence, communications, and battlefield management platforms.

EXPERIMENTAL UNITS

Restricted and advanced systems built around technologies that can fundamentally change battlefield behavior.

Every unit exists for a purpose.

Every unit has strengths.

Every unit has limitations.

YOUR MILITARY REMEMBERS

Obsidian Protocol is built around the concept of a persistent military.

Your forces are more than disposable pieces.

Their history matters.

Their condition matters.

Your decisions matter.

Losses matter.

Repairs matter.

Resources matter.

Equipment matters.

The military you bring into the future is shaped by what happened previously.

This creates a strategic relationship between battles rather than treating every match as a completely isolated event.

MULTIPLAYER WARFARE

Obsidian Protocol is designed around multiplayer warfare where opposing commanders compete through planning, information, autonomy, positioning, logistics, and decision-making.

The objective is not simply to see who can click fastest.

It is to determine who can build the better military system, establish the better intent, maintain better information, exploit the enemy's weaknesses, and adapt when the battlefield stops behaving as expected.

Two players can issue similar objectives and still produce completely different outcomes.

Because their militaries are different.

Their information is different.

Their commanders are different.

Their positioning is different.

And their decisions are different.

EVERY BATTLE CAN BECOME DIFFERENT

A battle might begin with a straightforward objective.

Then something changes.

A reconnaissance drone discovers an unexpected force.

A communications relay is destroyed.

A commander loses contact with headquarters.

An armored unit advances too far.

A sensor becomes degraded.

Weather reduces detection capability.

An enemy force disappears from your network.

Your intelligence becomes stale.

A subordinate commander makes a different decision than you expected.

Suddenly the original plan no longer works.

You must adapt.

Not by clicking faster.

By thinking like a commander.

YOU ARE THE COMMANDER

Obsidian Protocol is designed around a different player fantasy.

You are not supposed to personally drive every vehicle.

You are not supposed to manually direct every shot.

You are not supposed to babysit every unit.
You are responsible for the military.
You establish the objective.
You determine the intent.
You establish priorities.
You decide acceptable risk.
You manage information.
You organize the force.
You deploy the military.
Then you watch your decisions collide with reality.
Sometimes your plan works.
Sometimes it doesn't.
Sometimes your commanders surprise you.
Sometimes your assumptions are wrong.
Sometimes the battlefield gives you information you never expected.
And sometimes the most important decision is knowing **when to change the plan**.

COMMAND INTENT. UNLEASH AUTONOMY. WITNESS WAR EVOLVE.

Obsidian Protocol: Autonomous Warfare is a military strategy experience built around autonomous warfare, intelligent command structures, imperfect information, persistent forces, large-scale battles, logistics, information warfare, physical military infrastructure, multiplayer competition, and full VR command.

It is not about controlling more units.

It is about **commanding a better military**.

It is not about knowing everything.

It is about **making decisions with the information you actually have**.

It is not about scripting the battlefield.

It is about **creating the conditions for the battlefield to evolve**.

You give the order.

Your commanders interpret it.

Your units execute it.

The battlefield responds.

And war evolves.
